@jeffsundell. It's free, open-source, full-featured and works great. Q: Do any countries currently have a climate similar to what we had in the late Cretaceous? I'm not referring to "climate change" as much as I'm referring to more natural, warmer periods in Earth's history. Could anyone identify a natural, warmer period during which humans could still live? I imagine it'd have to be a colder period, but I'd be interested to know what the temperature was and how close we can get. A: The Earth's Climate has been stable for the past 80 mya. The history of life on Earth is pretty good at sustaining through all those climatic oscillations. This is because, unlike an ice-ball, the Earth's climate is not dependent on gravitational friction and thermal conduction but rather on the sun's energy. The Earth does not get out of orbit as a planet but keeps rotating about the sun at the same rate as the sun orbits. The sun's energy does not change and the heating of the Earth-sun system does not change. Thus, the Earth-sun system keeps warming up until it reaches a certain stable temperature range. The situation changes when ice is added to the surface of the Earth and when CO2 is pumped into the atmosphere. It takes about a million years to add a kilometer to the ice sheets at the poles (on the average of a1d647c40b

On the role of voltage-dependent conductances in the slow components of Ca²⁺-induced Ca²⁺ release from bovine skeletal muscle sarcoplasmic reticulum.
